

Progress Report

Day 14 — Frontend Routing Expansion & Axios Interceptor Configuration

Task Management MERN Stack Platform

Shafin Nigamana | 02 June 2026

1. Day-14 Objective

The objective of Day 14 was to extend the frontend routing structure, create placeholder pages for upcoming modules, and configure a centralized Axios interceptor for authenticated API communication using JWT tokens.

2. Tasks Completed

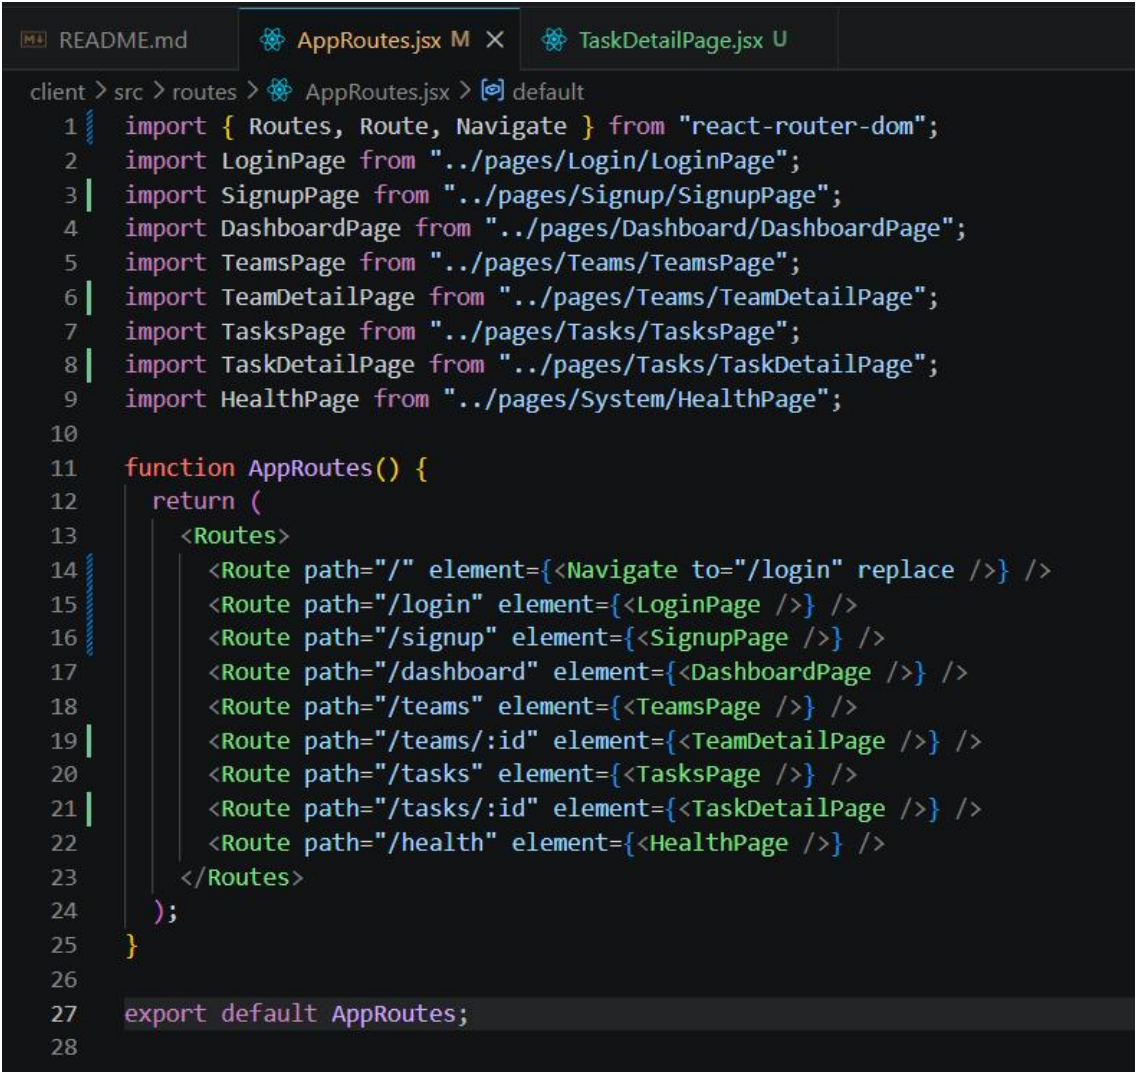

Route Expansion

- Extended the React Router configuration to support additional application pages required for authentication and detail views.

Configured routes:

- /login
- /signup
- /dashboard
- /teams
- /teams/
- /tasks
- /tasks/
- /health

- Added root route redirection to ensure users are directed to the login page when accessing the application entry point.

```
client > src > routes > AppRoutes.jsx > default
1 import { Routes, Route, Navigate } from "react-router-dom";
2 import LoginPage from "../pages/Login/LoginPage";
3 import SignupPage from "../pages/Signup/SignupPage";
4 import DashboardPage from "../pages/Dashboard/DashboardPage";
5 import TeamsPage from "../pages/Teams/TeamsPage";
6 import TeamDetailPage from "../pages/Teams/TeamDetailPage";
7 import TasksPage from "../pages/Tasks/TasksPage";
8 import TaskDetailPage from "../pages/Tasks/TaskDetailPage";
9 import HealthPage from "../pages/System/HealthPage";
10
11 function AppRoutes() {
12   return (
13     <Routes>
14       <Route path="/" element={<Navigate to="/login" replace />} />
15       <Route path="/login" element={<LoginPage />} />
16       <Route path="/signup" element={<SignupPage />} />
17       <Route path="/dashboard" element={<DashboardPage />} />
18       <Route path="/teams" element={<TeamsPage />} />
19       <Route path="/teams/:id" element={<TeamDetailPage />} />
20       <Route path="/tasks" element={<TasksPage />} />
21       <Route path="/tasks/:id" element={<TaskDetailPage />} />
22       <Route path="/health" element={<HealthPage />} />
23     </Routes>
24   );
25 }
26
27 export default AppRoutes;
28
```

Figure 2.1 — Updated React Router configuration with application routes.

Placeholder Page Creation

- Created initial page modules for future frontend development.

Created:

- Signup Page
 - Team Detail Page
 - Task Detail Page
- Established placeholder components to support route verification and future feature implementation.

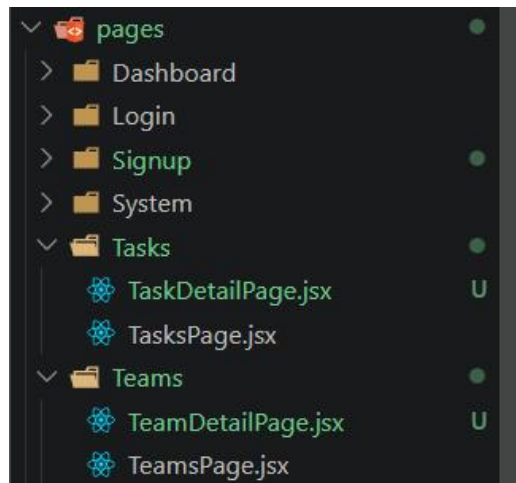

Figure 2.2 — Placeholder pages created for Signup, Team Detail, and Task Detail modules.

Axios Centralization Verification

- Reviewed the existing Axios service configuration.

Verified:

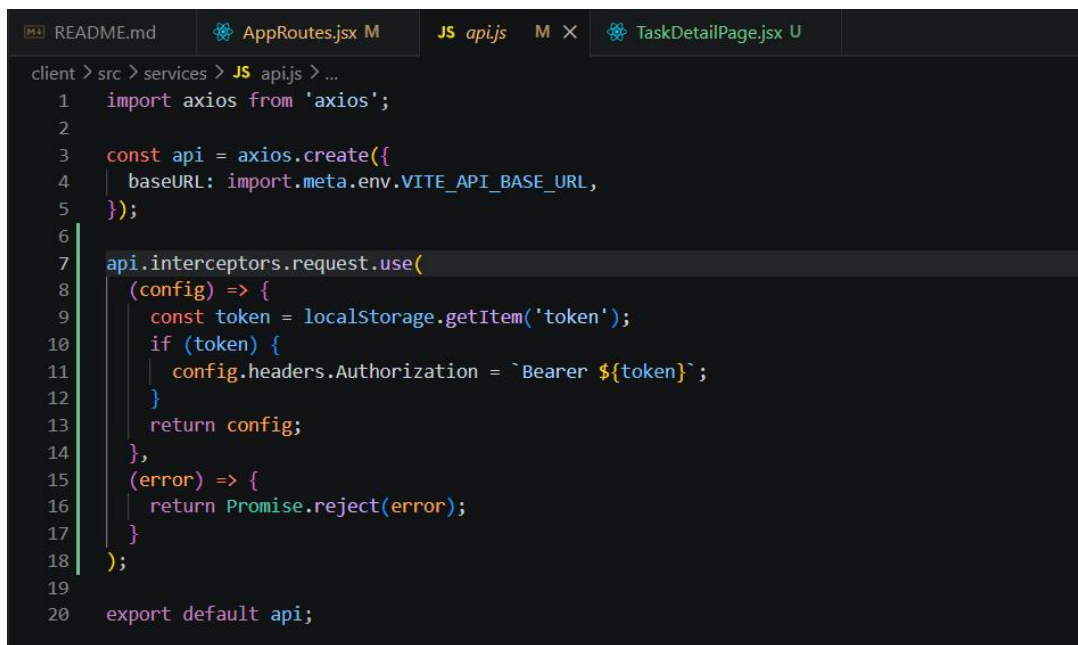

- Centralized API instance creation
 - Environment-based API URL configuration
 - Shared API communication layer
- Confirmed that all future API requests will utilize a common service layer.

JWT Interceptor Implementation

- Implemented an Axios request interceptor.

Configured functionality:

- Reads JWT token from localStorage
 - Automatically attaches Authorization header
 - Uses Bearer token authentication format
 - Applies authentication header to all outgoing API requests
- Prepared the frontend for upcoming authentication integration activities.

```
client > src > services > JS api.js > ...
1  import axios from 'axios';
2
3  const api = axios.create({
4    |   baseURL: import.meta.env.VITE_API_BASE_URL,
5    | });
6
7  api.interceptors.request.use(
8    | (config) => {
9    |   | const token = localStorage.getItem('token');
10   |   | if (token) {
11   |   |   | config.headers.Authorization = `Bearer ${token}`;
12   |   |   | }
13   |   | return config;
14   |   | },
15   | (error) => {
16   |   | return Promise.reject(error);
17   |   | }
18   | );
19
20 export default api;
```

Figure 2.3 — Centralized Axios instance configuration.

Route Verification

- Verified successful navigation to newly created frontend routes.

Tested pages:

- Signup Page
 - Team Detail Page
 - Task Detail Page
- Confirmed correct route parameter handling for detail pages.

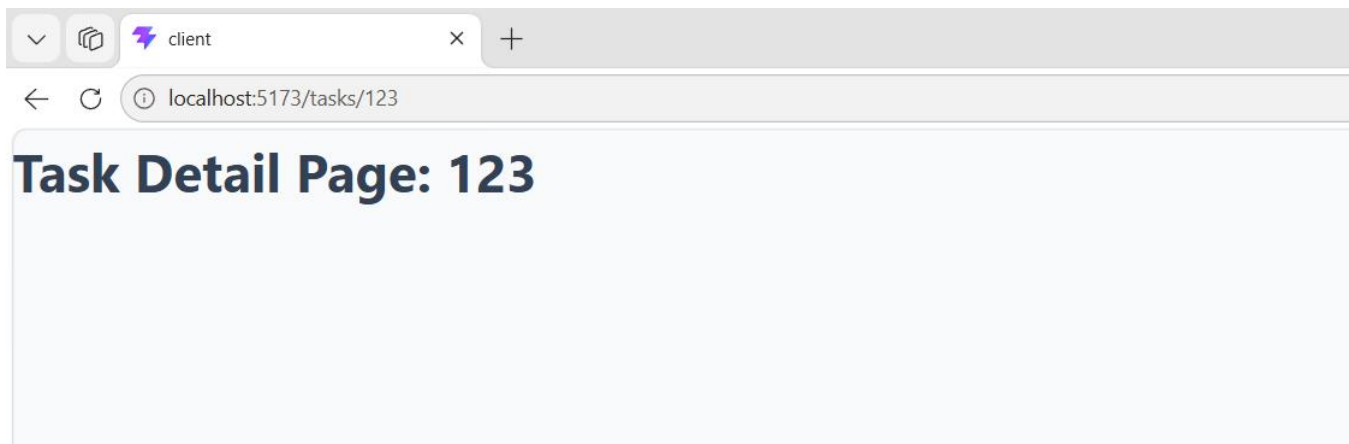

Figure 2.6 — Task Detail route verification.

3. Conclusion

Day 14 focused on strengthening the frontend navigation and API communication foundation. Additional routes were successfully configured, placeholder pages were established for future modules, and Axios request interception was implemented to support JWT-based authentication. The application is now prepared for login, signup, and authentication state management development in the next phase.
