

Progress Report

Day 20 — Kanban Board Planning and User Interface Enhancement

Task Management MERN Stack Platform

Shafin Nigamana | 08 June 2026

1. Day-20 Objective

The objective of Day 20 was to research drag-and-drop technologies, design the planned Kanban board interface, define the task status update workflow, prepare audit logging integration, and refine the application's visual design to improve usability and consistency before the implementation of Week 4 features.

2. Tasks Completed

Understanding Drag-and-Drop Solutions

As preparation for the Kanban board implementation, different React drag-and-drop solutions were reviewed to determine which would best suit the project requirements.

Two popular options were considered:

- react-beautiful-dnd
- @dnd-kit

After comparing both approaches, @dnd-kit was selected for future implementation because it is actively maintained, flexible, and better aligned with modern React development practices.

Understanding its component structure and event flow provided a clear direction for implementing task movement between workflow columns in the next development phase.

Kanban Board Interface Planning

A preliminary Kanban board layout was designed to visualize how tasks will be managed within teams.

The planned structure consists of three workflow stages:

- To Do
- In Progress
- Done

Each task will be represented as an individual card that can be moved between columns as work progresses. The layout was designed to remain simple, clean, and consistent with the overall design language of the application.

Task Status Update Workflow Planning

The workflow for updating task statuses was planned to ensure smooth communication between the frontend and backend systems.

The proposed process is:

This workflow will allow users to update task progress directly from the Kanban board while maintaining synchronization with backend data.

Audit Logging Flow Planning

The existing audit logging architecture was analyzed to determine how task movements should be recorded once drag-and-drop functionality is introduced.

The planned workflow is:

The audit log will capture essential information including:

- User performing the action
- Task identifier
- Previous status
- Updated status
- Timestamp

This approach ensures that task activity remains traceable and consistent with the existing audit logging mechanism already implemented within the project.

Frontend User Interface Enhancement

In addition to planning activities, the existing frontend interface was refined to improve visual consistency and overall usability.

Enhancements included:

- Improved typography hierarchy
- Refined spacing and alignment
- Consistent card styling
- Improved header and sidebar presentation
- Better content organization
- Responsive layout refinements

The objective was not to redesign the application but to elevate the existing interface to a more polished and professional standard while preserving all current functionality.

3. Conclusion

Day 20 focused on preparing the foundation for the Kanban board module while improving the overall frontend presentation of the application. A suitable drag-and-drop solution was selected, the workflow for task status updates was planned, and audit logging integration was outlined. Additionally, several user interface refinements were applied to improve readability, consistency, and usability across the platform. These activities provide a solid foundation for implementing the Kanban board and task workflow management features in the upcoming development phase.
